For: Circumferential Compression Device for Intracavernosal Anesthesia and Method
for Using Same

ABSTRACT

5 A preferred embodiment of the device of the invention, which is adapted to be applied
circumferentially about a phallus, having a perimeter, and to facilitate intracavernosal anesthesia,
generally comprises: a strip having a length at least slightly greater than the perimeter of the
phallus, and a first end and a second end; and a hook and loop closure for releasably fixing at
least a portion of the strip proximate the first end to a second portion of the strip
